Feynman parameterization

Here, we perform the following expansion:

$$\frac{1}{A_1} \cdots \frac{1}{A_n} = (n-1)! \int_0^1 dz_1 \int_0^{1-z_1} dz_2 \cdots \int_0^{1-z_1-\dots-z_{n-1}} dz_n \frac{1}{(z_1 A_1 + \dots + z_n A_n)^n}$$

We use this form because a single denominator raised to a power can be simplified with the Golden Integral.

$$\frac{0.0625e^2}{\pi^4}1\int\limits_0^1dz_1\int\limits_0^{-z_1+1}dz_2\int\frac{d^dp}{(2\pi)^4}\left(\frac{\epsilon_{nu}(k)\bar{\epsilon}_{mu}(k)m^2\gamma^{mu}\gamma^{nu}+\epsilon_{nu}(k)\bar{\epsilon}_{mu}(k)mk_{sigma_1}\gamma^{nu}+\epsilon_{nu}(k)\bar{\epsilon}_{mu}(k)mp_{sigma_1}\gamma^{nu}+\epsilon_{nu}(k)mp_{sigma_1}\gamma$$

Golden Integral

We resolve internal momentas with this transformation:

$$\int \frac{d^d q}{(2\pi)^d} \frac{(q^2)^a}{(q^2 + D)^b} = i \frac{\Gamma(b - a - \frac{1}{2}d)\Gamma(a + \frac{1}{2}d)}{(4\pi)^{d/2}\Gamma(b)\Gamma(\frac{1}{2}d)} D^{-(b - a - d/2)}$$

After this section, all internal momenta should disappear. We will now resolve each term in a queue. Each term may produce additional terms, which are pushed to the back of the queue and resolved later.
